In preclinical safety studies, pathologies of the respiratory system can be a result of an intercurrent disease or can be induced by systemically administered drugs. Intranasal or inhalation modes of therapy pose particular challenges in terms of the formulations and technologies required to administer a drug.

This work covers effectively all aspects of drug-induced pathology that may be encountered within preclinical toxicity studies. It fills a gap in the pathology literature relating to the preclinical safety assessment of new medicines. It systematically describes, in one volume, both spontaneous and drug induced pathology on an organ by organ basis.

Histopathology of Preclinical Toxicity Studies - 3rd Edition

Histopathology of Preclinical Toxicity Studies. Pathology represents a challenge for everybody involved in drug development. Even trained pathologists with expertise in toxicological pathology have to make the difficult prediction of whether any drug induced pathology in animals is likely to occur in humans.

Types of Preclinical Safety Studies •The number and types of studies required depend on the therapeutic indication. • Drugs for life-threatening illnesses require fewer studies to reach the clinic. • In general, animal studies are conducted in two species, one rodent (e.g., rat, mouse) and one non-rodent (e.g., dog, nonhuman primate).

Basic Overview of Preclinical Toxicology Animal Models

This book describes histopathological assessment of preclinical toxicology studies that are conducted to assess the safety of novel drugs. It discusses the implications of drug-induced changes that may be relevant to the critical early stages of the development of new therapeutic agents, notably prior to their first administration to humans and during early clinical trials.
